

API Feedback - From Product board

(1) Product/Variant Creation (2026)

We have a partner who has a tool to connect Plytix with Business Central ERP. They also connect BC to Shopify. They are listening to signals from Shopify when we create a product so that they can go and fetch inventory and price from BC.

I've informed him of the following:

The product creation in Shopify is done in 2 separate stages when the feed sync happens:

1. We create the base product (title, description, options framework, etc.) without variants or SKUs
2. Another API call hits immediately after and creates all variants including the SKU (if the SKU attribute is mapped in the channel configuration)

His response was that: The problem for us is that products/update, which we support, sends a LOT of data and blocks our queues. That's why we don't use that. Is there a chance this is something that can be changed on your side? We also create products in Shopify and we do it with one api call, creating products and variants together.

(2) MCP Integration: AI-powered content generation and internal data access via Claude/Copilot (2026)

Suggestion: build a Plytix MCP that allows clients to connect their PIM data directly to AI tools like Claude and Microsoft Copilot.

"I'd like to vibe code campaign pages and catalogs and niche websites based on the PIM data. ([Claude.ai](#))

This would speed up things massively. Also generating content for various channels directly from product data would be impactful.

Beside that, I'd like to make commercial/product data available for internal teams via chat interfaces (Copilot) so they always have access to the latest content without leaving their workflow."

(3) API V2 Feedback from Partner (2025)

We recently had to upgrade some of our clients to the new product v2 API endpoints and would like to share some feedback on how that process went. Hopefully, this will give some insights on what could be improved.

Deprecations warnings

I could be wrong on this, but the deprecation of the product v1 API isn't mentioned anywhere besides the e-mail we received. It would be nice to have this covered in the Plytix API docs or on your website's blog. Having a reference when informing our clients about upgrades is helpful.

It provides an "official" source for why upgrades are necessary, which is harder to do with just an email.

Documentation is not up to date

Currently, the docs mention the following, which to me sounds like v2 isn't stable yet:

This version of our Product API is a draft, meaning it's still evolving and may have new features added over time. One of the main changes is in the response structure, designed to make requests faster, more consistent, and better aligned with what users see in our web application.

If you notice any issues or bugs, please let us know so we can address them as quickly as possible. For now, V1 endpoints will remain active, but we encourage you to start familiarizing yourself with the changes in V2 described in this guide.

Additionally, the examples in the API documentation differ from the actual API responses.

It seems they haven't been updated to align with the new v2 endpoints, as they reference fields that have changed or been deprecated. You may use the Product Search request as an example here.

Missing breaking change notices

After testing on our staging environments, we noticed some breaking changes in the API that weren't mentioned in the upgrade guide.

The "id" field has been renamed to "_id"

The "related_products" field under relationships has been renamed to "links_to"
Timestamps now use a different format

Versioning strategy

We were a bit confused when we noticed that only certain endpoints would be available on v2 of the API. We're not totally sure on what the versioning strategy is here, but would this mean that each "group" of endpoints would have their own version? To give you some context, we open-sourced our Plytix SDK for Laravel and had to make several changes. Releasing all API endpoints under v2 would have made this process much easier.

<https://github.com/esign/laravel-plytix/pull/3/files>

Release schedule

As the Plytix API does not have a set release schedule for new API releases, having only 2 months to upgrade is short.

E.g. Shopify releases new API's every quarter and deprecations are known a year ahead of time.

(4) Bulk API Error handling

One thing I would like to mention is that we'd like to emphasize how crucial the ability to properly handle errors is for us when using the Bulk API. At the moment we have no way of differentiating silently ignored errors from products that have no data change since in both cases the product is omitted from the processed products summary, this leaves us no way to act on or find failed uploads. This creates significant inefficiency and uncertainty in our workflows, as we need to reprocess and investigate manually, which defeats the purpose of using the Bulk API for optimization.

Timing is of the essence here. We are about to launch a solution that is heavily reliant on the Bulk API in the coming weeks, and we are currently finalizing UAT testing. The lack of error logging is one of the highest issues we are facing during these tests, as it directly impacts the efficiency and reliability of product data flowing into Plytix.

Having error logs (even a basic structure with SKU references and error reasons) would allow us to:

Confidently process jobs without manual checks.

Reduce the operational overhead of troubleshooting.

Ensure data integrity across large batches of SKUs.

We fully understand that the API is still in Beta and new features are subject to prioritization. Still, given the timing and impact on our go-live, this functionality is essential for us to adopt the Bulk API at scale. We would greatly appreciate if you could highlight this as a high-priority request to your Engineering team.

Please let us know if there's any way we can provide more details on our use case to support the case for implementing error logging.

(5) We need to improve the integration of BULK API (Feedback from support) (2024)

From Support we observe the Bulk API is an ad-hoc set of endpoints. Their documentation is shared on a PDF, which makes difficult to update (even though when the api itself has not been updated in quite some time, is a general bad practice).

The file we share is the one attached in the linked ticket.

Since we do offer the bulk api in our pricing:

It would be best to start including the bulks in the public APIDOC.

<https://apidocs.plytix.com/>

Why is it important?

Customer: See parent ticket task. Some features are not supported and is difficult to users identify that. (GTIN update)

Compatibility: Knowing which features will be supported by bulk in the future (LVL 3 variants, etc.)

Documentation: Having it on a PDF is not a good practice.

Test Coverage: This part I don't know, we'll probably need to consult to QA team.

Knowing our limits: This part is the technical challenge we face. Bulk api calls are not "just another api call". they are way more costly in terms of processing. We currently process them as another api call, but to be honest we can't possibly expect them to be processed at the same rate as the rest. This can be backed up with Engineering team

This consultation is to find answer to many questions:

-Will we continue offering this bulk api?

- Will we add the bulk to the apidoc, in case negative which team is maintaining this documentation?
- Will we ever create a rate limit for bulk apis? (Note that they can't possibly be considered within the general rate as these are way slower, we can't process the published number if they are all bulks).
- Is this bulk api considered for update for the upcoming features (L3 Variants)?

(6) Advance Notification for Changes in API Documentation (2023)

We are in the process of building an integration between Microsoft Business Central and Plytix.

We have a few attributes, such as colour, size, gender, age group, colour group, which should be dropdown or multiselect. What we experience is that we can't add new options to these attributes on import through the API, even though the attributes are set to "allow" add options on import. This would be the easiest solution for us, by far, as the customer on regular basis adds things like new colours.

Alternatively we have found that in the API documentation, it says under "Modify attribute" that: DropdownAttribute and MultiselectAttributes can also patch available options. NOTE options will replace existing ones:

<https://apidocs.plytix.com/#82eb011e-2bc8-4ce4-94a1-5bc0d79b3b69>

Is it right that it is not possible to add options to these attributes, without replacing existing ones? That would mean the process would be:

Get list of existing attribute values – Check if the attribute value for the new product is present – If not, add the new attribute value – Upload the new list of attribute values, through the modify attribute call.

Hope we might be overlooking something and there is an easier way to add to these attributes
