

Plytix API Documentation — Project Requirements

1. Introduction

Plytix is preparing a new developer documentation experience that will centralize the current and future technical resources around:

- **API v1/v2**
- **API v3**
- **Plytix MCP**
- **Official SDKs**

The main objective is to replace the current fragmented documentation with a single developer portal that combines API reference, implementation guidance, product context and AI-friendly documentation.

Roadmap

The documentation project should be aligned with the product roadmap:

- **API v3:** main priority and future recommended API version.
- **New Channel Integrations(ongoing):** Implementation of Channels by external providers (v0.1.0). This is the business/integration design spec for how an External Provider integrates with Plytix to synchronize a product catalog to a channel. OpenAPI available.
- **API v1/v2:** maintained during the transition period for existing integrations.
- **MCP:** incorporated into the developer portal as part of the new developer ecosystem.
- **SDKs & CLI:** added as they become available.
- **Guides and additional content**

2. Project Scope

The new developer portal should include:

API v1/v2

Existing API documentation should remain accessible for current integrations.

The portal should clearly differentiate legacy API versions from API v3 and support a future migration/deprecation strategy.

API v3

API v3 should be the main focus of the new documentation.

It should include:

- Full public API reference.
- Authentication.
- Filtering, pagination and sorting.
- Request and response examples.
- Errors and limits.
- Relevant implementation guidance.
- Public endpoint coverage.

The scope should also include the **Channels endpoint currently being developed as part of the Hotglue integration work**, provided it is confirmed as part of the public API v3 scope.

MCP (Product MCP)

A dedicated MCP section should cover:

- Overview and capabilities.
- Setup and authentication.

- Available tools.
- Supported clients.
- Examples and common use cases.

SDKs

Documentation should include official SDKs as they are released:

- Installation.
- Authentication.
- Quickstarts.
- Examples.
- Language-specific guidance where relevant.

Guides & Informational Content

The portal should go beyond API reference and include explanatory and workflow-based content.

Potential topics include:

- Getting started.
- Plytix data model.
- Core API concepts.
- ERP integrations.
- Large catalog synchronization.
- MCP use cases
- Common implementation patterns.

The final information architecture and guide priorities should be defined during the discovery phase.

3. Requirements from WriteChoice

To carry out the project, WriteChoice has requested:

Discovery

- Around **2–3 hours of discovery calls** during the first phase.

- Participation from Product and Engineering where necessary.
- Business context, developer journeys, API workflows and core capabilities.

Technical Resources

Plytix should provide:

- Updated **OpenAPI specification** or, alternatively, an updated Postman collection.
- API keys and preferably access to a sandbox/test environment.
- Access to the documentation repository.
- Access to the selected documentation platform once defined.

Design & Branding

Plytix should provide:

- Brand guidelines.
- Existing visual assets and design references.
- Feedback from Marketing/Design.

WriteChoice would propose the main visual direction, homepage concepts, diagrams and other assets through **Figma** for review.

The level of customization will depend on the selected platform. Managed tools such as Mintlify, ReadMe or GitBook provide more predefined layouts, while open-source solutions such as Docusaurus, Fumadocs or Astro offer greater design flexibility.

4. Main Decisions Before Kickoff

Before starting the project, Plytix should confirm:

- Documentation platform.
- Branding/design requirements.
- Availability and status of the OpenAPI specification.
- Public API v3 endpoint scope.
- Whether the Channels endpoint will be included in the initial API v3 documentation.

- MCP readiness and timeline.
- SDK readiness and timeline.
- Internal stakeholders for technical and design review.

Additional Resources and Context
